

Visualizing Non-Functional Requirements Patterns

Sam Supakkul* and Lawrence Chung
The University of Texas at Dallas

Outline

1. What is the problem?
2. How and why is visualization expected to help?
3. Who is visualization for? How are they expected to use it?
4. What visualizations have been created?
5. How are they derived and constructed?
6. How do they work?
7. Show and tell
8. Have the visualizations been used in practice?
9. Self-critique
10. Future work

1. What is the problem?

When NFR knowledge is captured as text, it is hard to see the complex structure and relationships

Definition of information security and potential problems

“The term ‘information security’ means protecting information and information systems from unauthorized access, use, disclosure, disruption, modification, or destruction in order to provide—

(A) integrity, which means guarding against improper information modification or destruction, and includes ensuring information non-repudiation and authenticity;

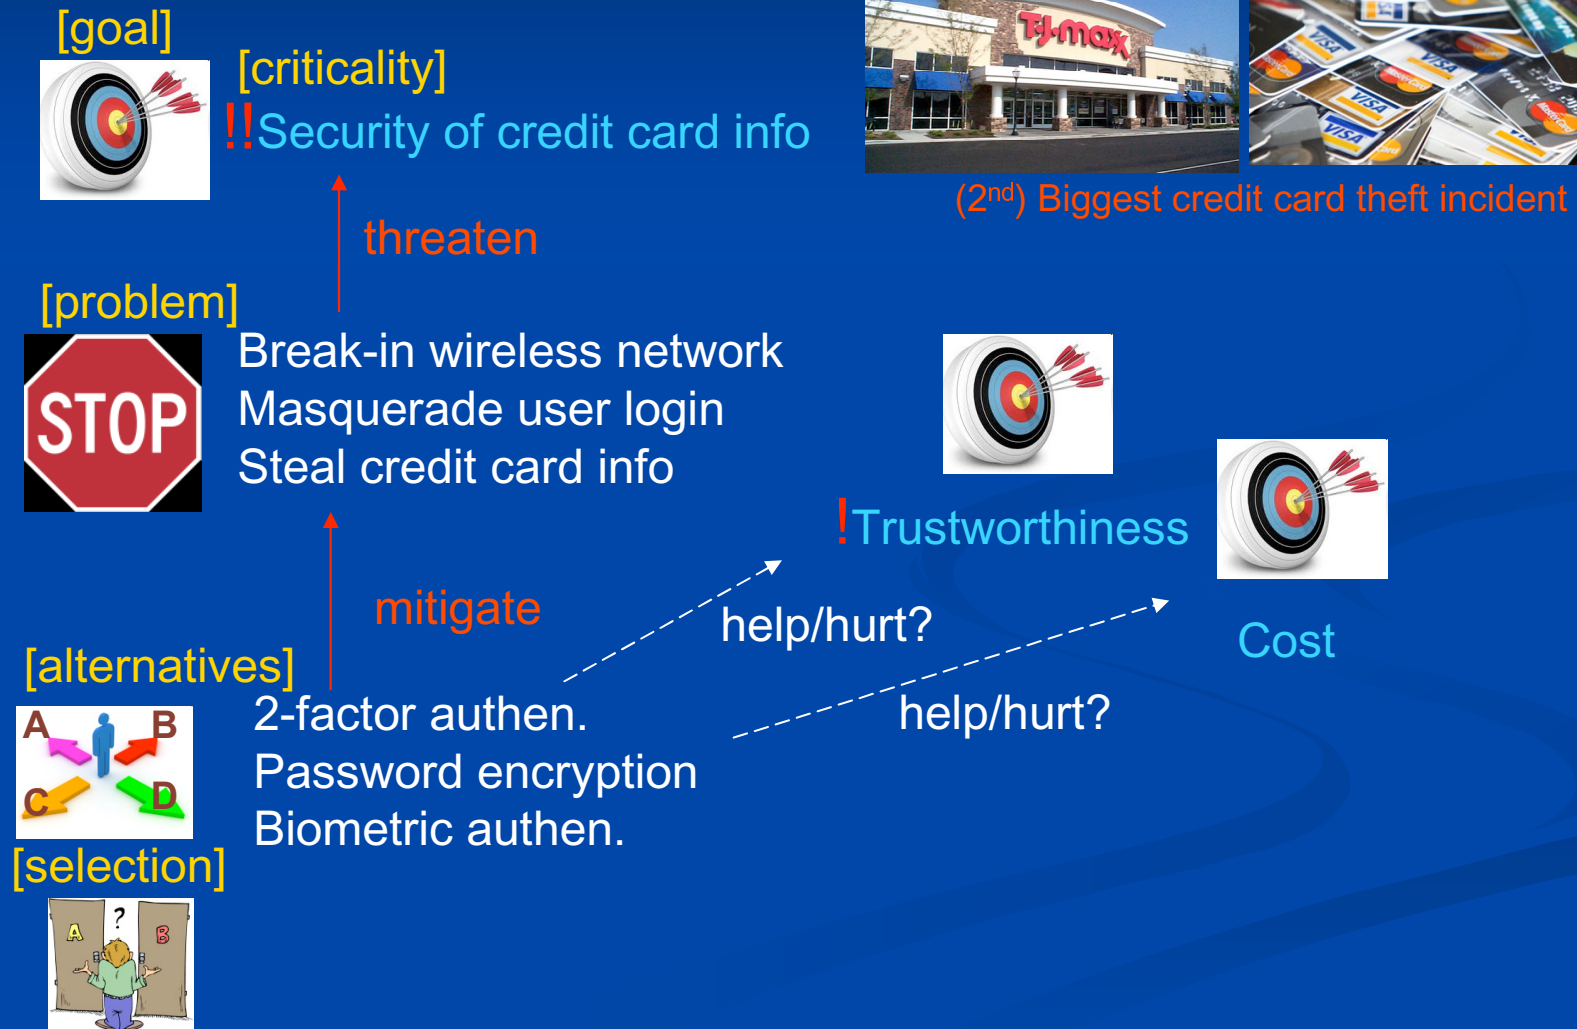

(B) confidentiality, which means preserving authorized restrictions on access and disclosure, including means for protecting personal privacy and proprietary information; and

(C) availability, which means ensuring timely and reliable access to and use of information.”

-- US Federal Information Security Management Act of 2002 (FISMA)

1. What is the problem? (cont.)

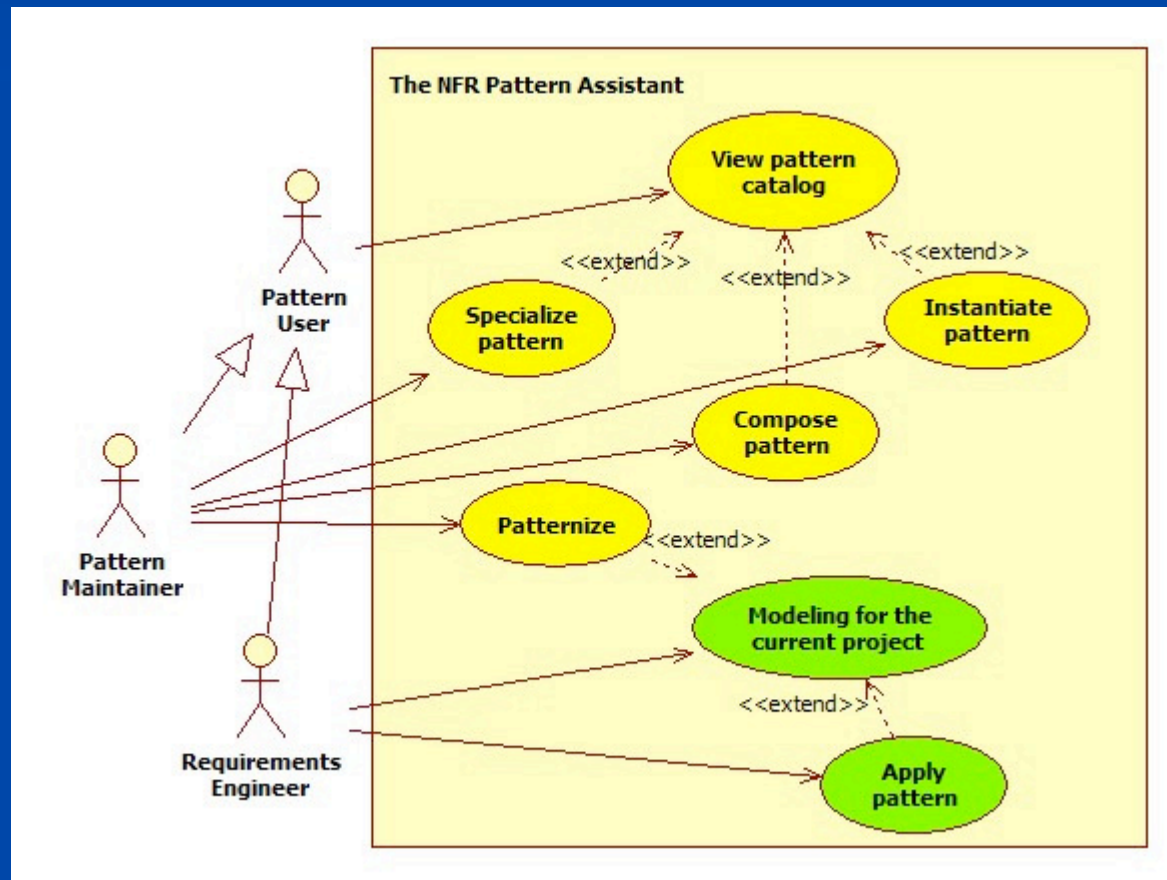

Text cannot easily show structure and relationships

2. How and why is visualization expected to help?

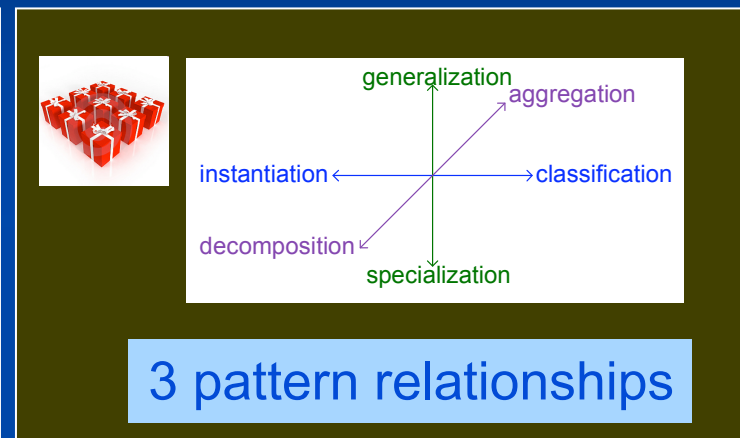

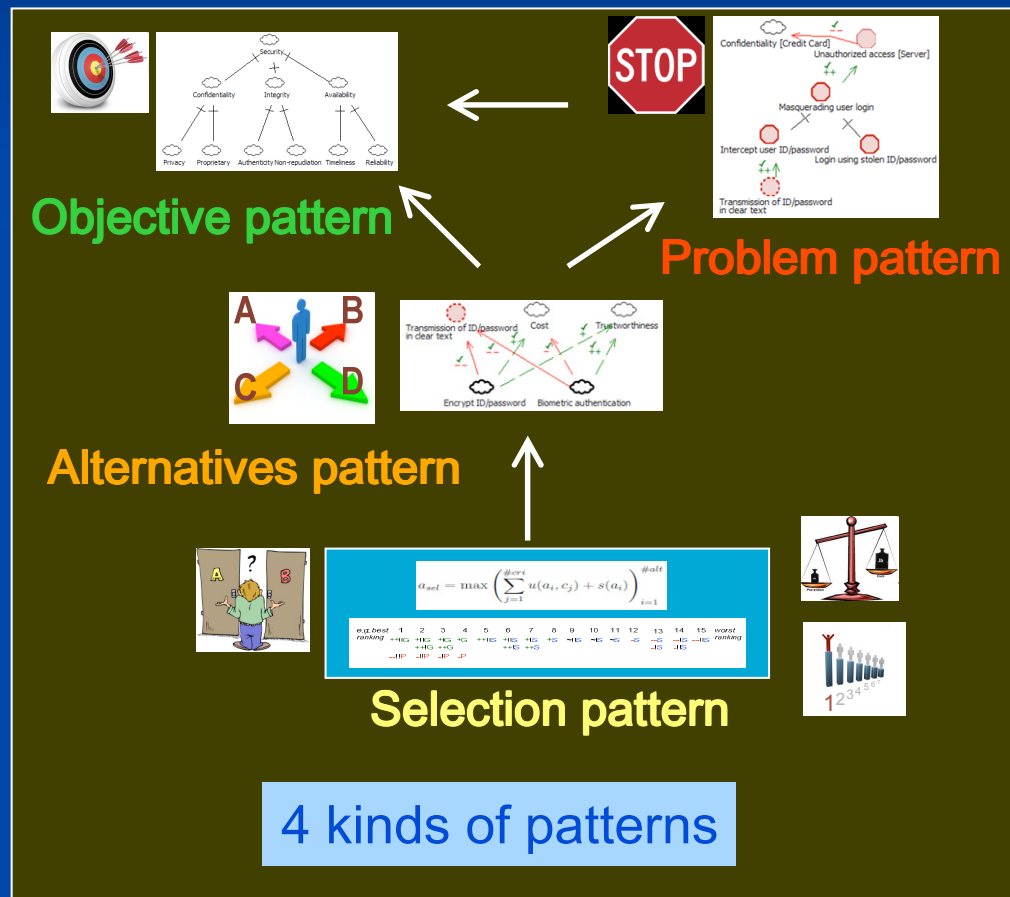

3. Who is it for? How is it to be used?

NFR knowledge is captured as visual patterns that can be organized and reused in a tool-based environment

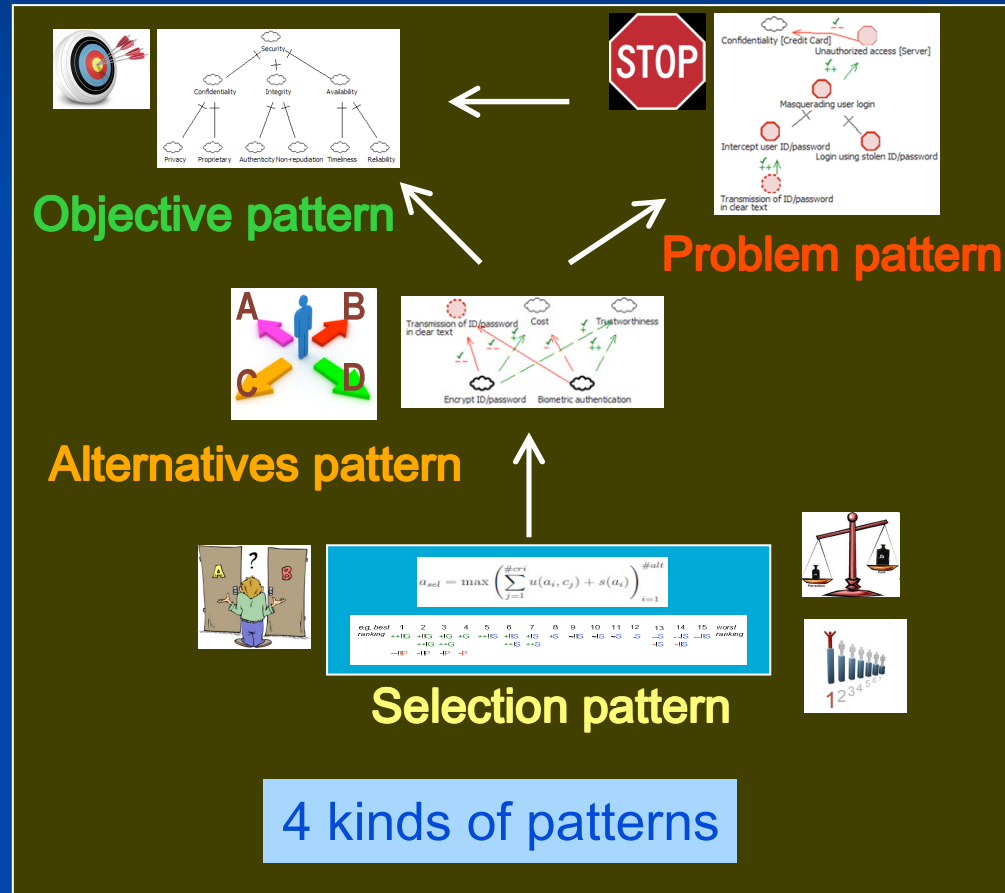

4. What visualizations have been created?

4 kinds of NFR patterns, 3 pattern relationships, 25 Refinement rules for tool support

4. What visualizations have been created? (cont.)

4 kinds of NFR patterns

4. What visualizations have been created? (cont.)

4 kinds of NFR patterns: a) objective pattern

An objective pattern captures a definition of an NFR as a softgoal (and sub-goals) to be achieved

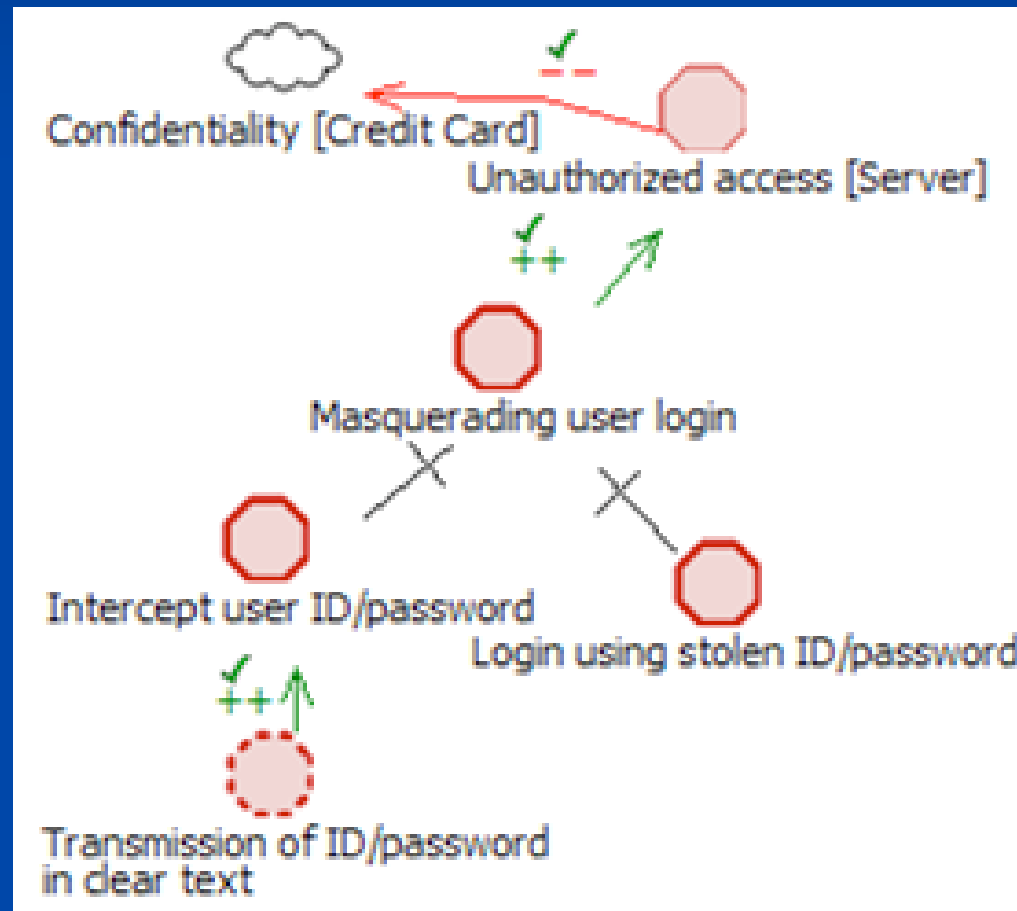

[US-FISMA law]

4. What visualizations have been created? (cont.)

4 kinds of NFR patterns: b) problem pattern

A problem pattern captures soft-problems or obstacles to achieving an NFR softgoal

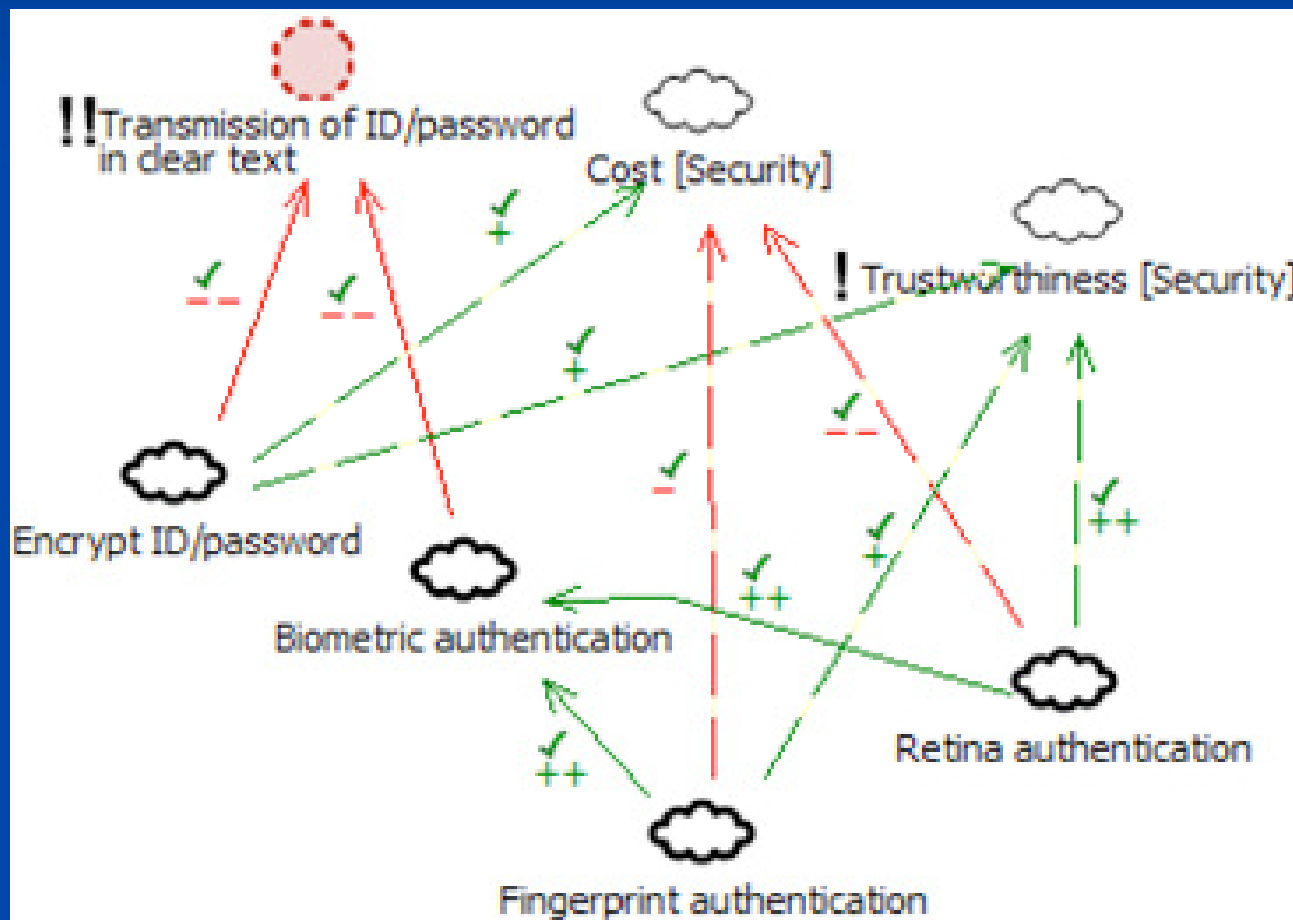

4. What visualizations have been created? (cont.)

4 kinds of NFR patterns: c) alternatives pattern

An alternatives pattern captures alternative means to achieving a softgoal or solutions to mitigating a soft-problem with side-effects

4. What visualizations have been created? (cont.)

4 kinds of NFR patterns: d) selection pattern

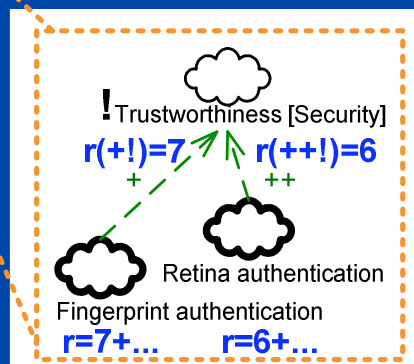

A selection pattern captures an application independent selection scheme

Weight-based quantitative selection

alternatives

Weight-based

Selection = **Highest** cumulative **weight**

criticality of goals/problems

contribution towards goals/problems

Widely used, but subjective

Rank-based

Selection = **Best** cumulative **ranking**

criticality-**contribution** combination

Less subjective, but need a ranking scale

Rank-based qualitative selection

4. What visualizations have been created?

3 pattern relationships,

3 pattern relationships

4. What visualizations have been created? (cont.)

3 pattern relationships: a) specialization

A specialization relationship links a pattern with more specific knowledge to another pattern with more general knowledge

Generalization
dimension

super-pattern

[US-FISMA]

sub-pattern

[PCI]

4. What visualizations have been created? (cont.)

3 pattern relationships: b) part-of

A part-of relationship represents that a smaller pattern makes up a larger pattern.

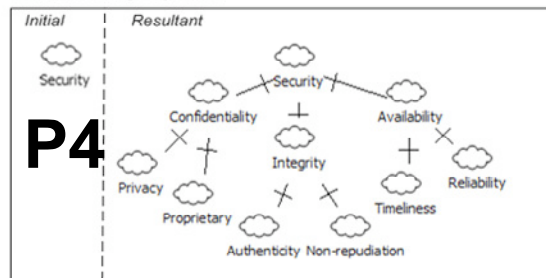

Aggregation
dimension

Poster

Visualizing Non-Functional Requirements Patterns

Sam Supakkul and Lawrence Chung

Motivation

- Knowledge of NFRs can have complex structure and relationships
- The structure and relationships are hard to see when knowledge is captured using text
- Captured knowledge should be conveniently reusable during requirements engineering

Objectives

- Knowledge of NFRs captured as visual patterns
- NFR patterns captured, organized, and reused in a tool-assisted environment

NFR Patterns

An objective pattern captures a definition of an NFR as a softgoal and its sub-goals to be achieved

Objective Pattern

A problem pattern captures obstacles and their causes that hurt the achievement of a goal.

Problem Pattern

An alternatives pattern captures alternative means to achieving a goal or solutions to mitigating a problem.

Alternatives Pattern

Quantitative Weight-based Selection = $\max(\sum \text{weight}(\text{criticality}) \times \text{weight}(\text{contribution}))$
Qualitative Rank-based Selection = $\text{best}(\sum \text{rank}(\text{contribution}, \text{criticality}))$

Quantitative and Qualitative Selection Rules

Selection Pattern

A selection pattern captures an application independent selection scheme, consisting of a series of weight/ranking assignments and a selection rule.

An example of a weight-based selection pattern application

Pattern Organization

Pattern Specialization

A composite pattern assembles smaller patterns to capture a larger chunk of knowledge

Pattern Composition

Pattern Instantiation

Tool Support

Each pattern is captured with single-step model refinement rules that can be applied by a tool to transform a target model when the pattern is applied

Model Transformation with Refinement Rules

8. Have the visualizations been used in practice?

Partial results from the TJX case study

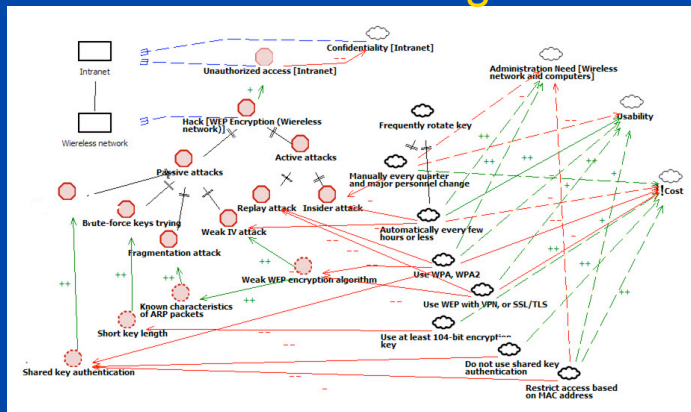

Break-in wireless network
Masquerade user login

9. Self-critique

10. Future work

Strengths

Structure and relationships among goals, problems, and alternatives are visually captured

Specialization, part-of, occurrence-of relationships among chunks of knowledge are visually captured

NFR knowledge is captured, organized, reused in a tool-assisted env.

Weaknesses (with possible solutions)

Costly and time-consuming to learn the notation and the tool

Dedicate few highly skilled subject matter experts as librarians

Quantitative weight-based selection is too subjective for some

Qualitative rank-based selection is available

Resulting models do not resemble the source models

Future visualization enhancement

Sharing patterns across groups?

Currently file-level locking/sharing supported

Thank you...
